

Workflow Outline

Batch Financial Report Processing for VAs, Part 2: Consolidation

This outline shows the five-stage workflow taught in the guide, from a VA's first time opening the tool to a completed, delivered Excel master sheet. Each stage lists what the VA does and what, if anything, requires client input first.

Stage 1: Decision Boundaries

The VA learns which settings must come from the client (file naming pattern, whether masking can ever be turned off, delivery location) before touching the tool at all.

Stage 2: One-Time Setup

The VA runs a single setup script that installs Python and the openpyxl add-on automatically. No manual downloads, no command line typing, no prior technical background needed.

Stage 3: Configuration

The VA opens the tool and sets the source folder, output folder, the file naming pattern, and confirms sensitive-field masking is on.

Stage 4: Loading and Review

The VA loads the report files, then uses search, sort, and detail view to spot-check the consolidated data before exporting anything.

Stage 5: Export and Delivery

The VA generates the Excel master sheet, a formatted table plus a summary tab, and delivers it to wherever the client has specified.

What Makes This Guide Different

- Includes a working, tested software tool, not just written instructions.
- Masks sensitive account and card numbers by default, everywhere the data appears, a real security feature most tools like this skip.
- Explicitly separates VA-level decisions from owner-level decisions, so the guide is usable without ongoing supervision for the routine parts.
- Setup requires no prior technical knowledge. Two double-clicks and the VA is running the tool.
- Pairs with Part 1: Extraction as a complete pipeline, but works fully standalone.
